1. Introduction

This project, titled *OpenSpace and Climate Reanalyzer Interface,* is a comprehensive capstone project for University of Maine Computer Science students on V-Model Violets (formerly known as Team Violet). This project will be developed in collaboration with Dr. Sean Birkel, a Research Assistant Professor at the Climate Change Institute, and Sean Laatsch, the Director of the Versant Planetarium at the University of Maine. This project will also be collaborating with Dr. Carter Emmart and Micah Acinapura from the OpenSpace team. The goal of this project is to create an image map server that utilizes data from the Climate Reanalyzer, enabling its use by OpenSpace and in planetariums or other research settings.

1.1 Purpose of This Document

The purpose of this System Requirements Specification (SRS) document is to define and describe the requirements (functional and non-functional) for the OpenSpace and Climate Reanalyzer Interface. This document will serve as a reference for our team, the clients, and the teaching staff for the Capstone class, outlining the functionality of the system, possible constraints, and expectations regarding performance, security, and design. The SRS document is intended for:

- Capstone Team Members: To lay out the project requirements to ensure the client's needs are met
- Clients: To ensure that the project is on the right track
- University of Maine Faculty: To assess the progress of the project

1.2. References

The table below lists the sources being used for this project be used currently:

Title	Author(s)	Publisher / Organization	Date	Citation
Climate Reanalyzer	Dr. Sean Birkel	Climate Change Institute, University of Maine	Ongoing	Birkel, S. (n.d.). Weather forecasts. Climate Reanalyzer. https://climatereanalyzer.org/
OpenSpace	OpenSpace Team	American Museum of Natural History	Ongoing	OpenSpace. (n.d.). OpenSpace. https://www.openspaceproject.com/

Apache HTTPD Server Documentation	Apache Software Foundation	Open Source	1997-Current	Apache Software Foundation. (n.d.). Apache HTTP Server Project. https://httpd.apache.org/
Software Engineering (10th Edition)	Ian Sommerville	Pearson Education	2015	Sommerville, I. (2015). Software engineering (10th ed.). Pearson Education.

1.3. Purpose of the Product

The Climate Reanalyzer OpenSpace interface project is set out to make the data gathered and used on the University of Maine's Climate Reanalyzer available for use in the OpenSpace planetarium software. This allows for coverage of data that OpenSpace may not have readily available yet. The incorporation of the Climate Reanalyzer into the OpenSpace system will allow for immersive and interactive displays of historical climate data across the globe in a planetarium setting. This product will allow for data such as temperature, climate change data, atmospheric pressure, and much more to be overlaid onto a model of Earth that OpenSpace has integrated into their software. The product will address both missing data and inconsistencies in existing data to provide a more accurate model of Earth in its current state and in previous generations. In conclusion, the product will help enhance science education for teaching and learning.

1.4. Product Scope

The Climate Reanalyzer (CR) system will provide a connection between the Climate Reanalyzer platform and the OpenSpace visualization software that is used in planetariums. Our primary goal is to make global climate and weather data from the CR visual on display for planetariums and other large digital environments.

Figure 1.1 Top-Level Use Case Diagram: Climate Reanalyzer

Figure 1.1 shows the overall scope of the system and how it will connect to the actors. The Interface will allow users to select and load climate maps from the webpage. The system will get that information, convert the map data into a tile map that can be sent to OpenSpace for viewing. The optional feature UC-4 will let the system show time series data from the CR, which is the second project goal. This diagram shows the inside system boundary and what the external.

2. Functional Requirements

This section is where the Functional Requirements for the OpenSpace and Climate Reanalyzer Interface are found. These are the requirements that explain what the project will do, and they focus more on specific actions that can be taken and how they will function. There are tests included for each requirement that describe specifically how we will verify the system's function.

Use Case #1: Map-Tile Conversion

Figure 2.1: Map-tile Conversion Use Case Diagram

Number	1	
Name	Map - Tile Conversion	
Summary	The system shall allow OpenSpace to display a tile map generated from a 2x1 map image when requested.	
Priority	5	
Preconditions	A user must request a map image	
Postconditions	The map image will be displayed within OpenSpace.	
Primary Actor	User	
Secondary Actors	Climatereanalyzer.org image data, Tile Server, OpenSpace, system	
Trigger	When the user selects a map to load.	
Main Scenario	**Step**	**Action**
	1	The user requests a new map.
	2	The System checks if that map is already available.
	3	The system sends requested tile data to OpenSpace for display.
Extensions	**Step**	**Branching Action**
	2a	If not already available, the system downloads the map image.
	2b	The system calls for GDAL and Apache to generate a tile map.
	2c	The system stores the tile map on the tile server.
Open Issues	Should the System automatically download and store all data from Climate Reanalyzer? Should the system only download new maps to the server if the map is requested directly?	

Test for Functional Requirement #1

To test this requirement, we will write some test code that will simulate a call from a user for a specific map. If the map is sent correctly, or if it is downloaded and stored correctly on the server, the test will pass. Otherwise, the test will fail.

Use Case #2: Downloading and Saving Map Files

Figure 2.2: Downloading and Saving Tile Files Use Case Diagram

Number	2
Name	Download and Save Map Files
Summary	The system should be able to download and save files containing 2:1 maps, allowing them to be used in the OpenSpace simulation on demand.
Priority	2
Preconditions	● The system has a connection to the internet. ● There are files present in the tile server ● There is sufficient space on the user's system for the download
Postconditions	● The selected maps are successfully saved to local storage. ● The system can access and load the saved maps on demand without needing to redownload them.
Primary Actor	User
Secondary Actors	Tile server, OpenSpace system
Trigger	When the user initiates the request to download maps to use them offline.

Main Scenario	Step	Action
	1	The user selects the tiles to download.
	2	The System connects to the tile server.
	3	The system downloads the files from the tile server and saves them locally to the user's device.
Extensions	**Step**	**Branching Action**
	2a	If the download fails due to the connection to the tile server, the system will alert the user
	3a	If the download fails (due to connection loss), the system pauses and will alert the user.
	3a	If the download fails due to storage issues, the system alerts the user to the insufficient space and prompts them to clear space or choose a different storage location.
Open Issues	If the download fails, should the system automatically attempt to resume the download once the connection has been restored, or should it wait for another prompt from the user?	

Test for Functional Requirement #2

To test this requirement, a request will be sent to the system to download a specific set of tiles for later use in the OpenSpace simulation. Once the request is made, the system should connect to the remote server, retrieve the requested tile files, and store them in the designated local directory. After the download process completes, the storage location will be checked to verify that the tile files exist and are accessible. If the files exist and are accessible, the test passes; otherwise, the test fails.

Use Case #3: Admins Uploading Large Data Files

Figure 2.3: Admin Uploading Large Data Files Use Case Diagram

Number	3	
Name	Admins Uploading Large Data Files	
Summary	The system shall allow administrators to upload large source images to be used by the tile server.	
Priority	4	
Preconditions	● The system has a connection to the internet. ● There are files present on the local machine ● There is sufficient space on the server to upload	
Postconditions	● The selected tiles are successfully saved on the server. ● The system can access and load the uploaded image.	
Primary Actor	Admin	
Secondary Actors	Tile server	
Trigger	When the user initiates the request to download tiles to use them offline.	
Main Scenario	**Step**	**Action**
	1	The admin finds a large image file to upload.
	2	The admin connects to the server.
	3	The admin uploads the file to the server
Extensions	**Step**	**Branching Action**
	2a	If the upload fails due to the connection to the tile server, the system will alert the user.
	3a	If the upload fails (due to connection loss), the system pauses and will alert the user.
	3a	If the upload fails due to storage issues, the server alerts the admin to the insufficient space.
Open Issues	If the upload fails, should the server save the upload progress, or should it delete progress until there is sufficient space?	

Test for Functional Requirement #3

To test this requirement, we will attempt to upload an image to the server. Then the server will be checked to see if the images are present. If they are, the test passes. If the images are not present, the test fails.

Use Case #4: The System listing available Climate Reanalyzer Maps

Figure 2.4: Listing Available Climate Reanalyzer Maps Use Case Diagram

Number	4	
Name	List Available CR Maps	
Summary	The system shall expose a list of available Climate Reanalyzer maps with the layer name, date/time, and resolution. So the presenters can pick one in OpenSpace.	
Priority	4	
Preconditions	● The tile server is reachable ● CR list is available	
Postconditions	● The map layer is selected ● Metadata is cached for retrieval.	
Primary Actor	User	
Secondary Actors	Tile server, OpenSpace, ClimateReanalyzer.org	
Trigger	The user opens the “Select map”.	
Main Scenario	**Step**	**Action**
	1	User requests a list of maps.
	2	System fetches map catalog.
	3	System returns a list, user selects one.
Extensions	**Step**	**Branching Action**
	2a	If CR is not reachable. The system will serve the last known local catalog.
Open Issues	Is this possible? Can it auto-refresh?	

Test for Functional Requirement #4

To test this requirement, we will create a mock CR and serve it a catalog. We will then confirm that the program lists accurate data and selection returns the correct layer ID. If it does so, the test passes; otherwise, the test fails.

Use Case #5: Multiple tile levels

Fig 2.5: Being able to view tile maps on multiple levels, use case diagram

Number	5	
Name	Multiple tile levels	
Summary	The system shall provide inner (zoomed) layers of tiles upon request	
Priority	4	
Preconditions	● The server must successfully connect with OpenSpace ● The map must be loaded in OpenSpace ● The user must zoom in to trigger new tile requests	
Postconditions	● Tile layers will be provided while there is sufficient resolution in the CR image.	
Primary Actor	User	
Secondary Actors	Tile server, OpenSpace, Climatereanalyzer.org	
Trigger	When the user interacts with the OpenSpace interface and zooms in	
Main Scenario	**Step**	**Action**
	1	The user zooms in on the map in OpenSpace.
	2	OpenSpace requests the necessary tiles from the tile server
	3	The tile server responds with the requested image tiles
Extensions	**Step**	**Branching Action**
	2a	If there are more tile levels that can be loaded, OpenSpace requests these from the tile server.

	2b	If no further tile levels remain, OpenSpace will not load zoomed data
Open Issues	Should the system store all of the tile levels individually, or calculate image cropping and transformation upon request for a new tile level?	

Test for Functional Requirement #5

To test this requirement, we will visit server URLs specifying the inner tile layers that should be available and verify that an image is returned. This should call the server and request a tile, which the server should recognize and identify as an available layer, with which it will respond. If the image is displayed at the URL, the test passes; otherwise, the test fails.

Use Case #6: Animating Maps and Data

Fig 2.6: Being able to view a certain time span in OpenSpace in a way that looks animated use case diagram

Number	6
Name	Animating Maps and Data
Summary	The system shall display an 'animation' of data over a chosen time range for a region upon request.
Priority	2
Preconditions	● The server must successfully connect with OpenSpace ● The maps must be loaded in OpenSpace
Postconditions	● The maps over the time the user chose will be shown sequentially, giving the idea that an animation for the weather during that time is being shown.
Primary Actor	User
Secondary Actors	Tile server, OpenSpace, Climatereanalyzer.org

Trigger	When the user chooses a time range and chooses to view the 'animation' of the data over that time range.	
Main Scenario	**Step**	**Action**
	1	The user chooses to play the animation.
	2	OpenSpace requests the tiles for those times from the tile server.
	3	The tile maps are shown sequentially to give the illusion of an animation
Extensions	**Step**	**Branching Action**
	2a	If there are no tiles present in the tile server for the time the user requested, the system will display an error message explaining that the time range is invalid.
Open Issues	Should users be allowed to adjust playback speed?	

Test for Functional Requirement #6

> A request will be sent for a supported time-series dataset over a short range of timestamps. The system should retrieve and display tiles in order. If the animation shows correct visual progression without failure, the test passes; otherwise, it fails. Request a tile, which the server should recognize and identify as an available layer, with which it will respond. If the image is displayed at the URL, the test passes; otherwise, the test fails.

Use Case #7: Error and Feedback Handling

Fig 2.7: Being able to view a certain time span in OpenSpace in a way that looks animated use case diagram

Number	7	
Name	Handling Errors and Status Feedback	
Summary	The system shall alert users when tile retrieval, downloads, uploads, or catalog refreshes fail, displaying descriptive and actionable error messages.	
Priority	4	
Preconditions	● The system encounters an issue (e.g., connection failure, missing tiles, invalid user request)	
Postconditions	● The user is shown an error message that describes the error and why it happened.	
Primary Actor	User	
Secondary Actors	Tile server, OpenSpace	
Trigger	An error or unexpected behavior happens while the program is running	
Main Scenario	**Step**	**Action**
	1	A request or operation fails.
	2	The system identifies the error and its cause.
	3	The system displays an informational message to the user
Extensions	**Step**	**Branching Action**
	3a	The system logs the error and relevant logistical information, such as time, for the admin to analyze later.
	3b	If retrying the action is an option, the system prompts the user to retry.
Open Issues	Are there certain features that the system should automatically restart without prompting the user?	

Test for Functional Requirement #7

A failure will be forced by removing server connectivity and initiating a tile request. If the user receives a descriptive error message that matches the expected failure type, the test passes; otherwise, it fails.

3. Non-Functional Requirements

This section is where the Nonfunctional Requirements for the OpenSpace and Climate Reanalyzer Interface are found. These are the requirements that explain how the product will operate, and they focus more on how the project operates and less so on what the project can do. There are tests included for each requirement that describe specifically how we will verify the system's function.

Non-Functional Requirement #1

Requirement ID. 3.1:
The application should maintain stable performance under simulated concurrent usage, with response times under 2 seconds for all core functionalities when tested with a representative load using automated tools.
Priority - 3
Test: Run a stress test of many uses at once over a short period of time. If everything works as planned, it will pass; otherwise fail.

Non-Functional Requirement #2

Requirement ID. 3.2:
The application should be able to run on Chrome and all major Operating Systems.
Priority - 3
Test: Attempt to open the browser application on Chrome, as well as on Windows, Mac, and Linux systems. If all run successfully it will pass; otherwise, it fails.

Non-Functional Requirement #3

Requirement ID. 3.3:
The application's interface should be intuitive enough that new users are able to complete core application functions (e.g., downloading tiles, uploading maps) without direction at least 85% of the time.
Priority - 5
Test: Perform usability testing with a handful of various people and gauge their understanding of the program's operation through observation and post-test questions. If the vast majority of people (at least 85%) can understand with little assistance from the proctor, the program

passes; otherwise, it fails.

Non-Functional Requirement #4

Requirement ID. 3.4:
The application should be able to run both with and without an internet connection.
Priority - 2
Test: Test that the base functions of the application work both when connected to wifi and with no wifi or service connection.

Non-Functional Requirement #5

Requirement ID. 3.5:
The application must detect corrupted or missing map/tile data and notify the user with a clear error message, without crashing or losing existing unsaved work.
Priority - 3
Test: Provide corrupted or incomplete data files and verify that the application displays a descriptive error message and continues functioning normally.

Non-Functional Requirement #6

Requirement ID. 3.6:
The application's codebase shall conform to the group's coding standards and be structured to facilitate maintainability
Priority - 1
Test: Read through all code to determine whether or not the code follows the standards set by our group.

Non-Functional Requirement #7

Requirement ID. 3.7:
The application should work with the target OpenSpace versions and run on the ARCSIM-provided Linux VM.
Priority - 4
Test: Install ARMSIM VM, validate it works with OpenSpace.

Non-Functional Requirement #8

Requirement ID. 3.8:
The tile service must be ready within 20 seconds after the process starts on the ARCSIM VM.
Priority - 3
Test: Restart the service, measure the time it takes to start.

Non-Functional Requirement #9

Requirement ID. 3.9:
All source code shall be publicly accessible on GitHub
Priority - 3
Test: Verify that any GitHub user can access the repository holding the source code

Non-Functional Requirement #10

Requirement ID. 3.10:
The application shall be available 99% of the time
Priority - 4
Test: Log tile server uptime for a week through requests at regular intervals and calculate if availability is 99% or better

4. User Interface

See User Interface Design Document for *OpenSpace and Climate Reanalyzer Interface*

5. Deliverables

The following deliverable items will be supplied as described below to the clients, Dr. Sean Birkel and Shawn Laastch, throughout the development of the specified software. Most deliverable items will be made available as both a hard copy and a digital PDF.

Item	Format	Date of Delivery
Systems Requirement Specification	-Document Hard Copy -Document Digital Copy	10/29/2025
System Design Document	-Document Hard Copy -Document Digital Copy	11/17/2025
User Interface Design Document	-Document Hard Copy -Document Digital Copy	12/3/2025
User Manual	-Document Hard Copy -Document Digital Copy	5/8/2026
Administrator Manual	-Document Hard Copy -Document Digital Copy	5/8/2026
Copies of all Biweekly Status Reports	-Document Hard Copy -Document Digital Copy	Every two weeks-Mondays starting 10/20/2025
All source code	-GitHub Repository	5/8/2026
The executable program	-Web Application -Open Space Interface	5/8/2026

6. Open Issues

The following are issues that have been identified and not yet concluded. These issues will be addressed later in the development process according to the projected resolution dates.

- Tile server availability (2/16/2026)
- Function to process images from climate reanalyzer into tiles (2/2/2026)
- Function to select desired tiles based on area of interest and available data (2/9/2026)
- WMS file to store data for each map to be loaded into OpenSpace (2/23/2026)
- OpenSpace asset files for each map to be loaded (2/23/2026)
- JS webpage that can be opened within OpenSpace to browse the CR catalog (3/30/2026)

Appendix A – Agreement Between Customer and Contractor

The team at V-Model Violets and our clients, Dr. Sean Birkel, Shawn Laatsch, and the team at The OpenSpace Project, all agree that the product to be delivered will be a web-based platform that interfaces with OpenSpace to display tiled map data gathered from Climatereanalyzer.org. The product will be delivered on May eighth, which is after our COS 497 ends next semester. The product is being created for free as part of our capstone coursework, and while we will work diligently, the end product may not include all the features discussed.

Our team at V-Model Violets will continue to monitor the product in our free time, but after the completion of the course, the product will officially be completed and delivered as-is. However, as the product being created will be open source after completion, maintenance of the software will fall into the hands of anyone who wishes to contribute or improve on the work we complete. Our names and contact information will stay present on the site if we need to be contacted, and we would all be willing to support fixes that need to be done.

Appendix B – Team Review Sign-off

We, the team at V-Model Violets, all agree and sign off on all the information provided in this document. The document has been reviewed by all members, and we agree on its content, and it is formatted in a way we all agree on. No one in the team has any major issues with the document or its layout, but they will have the chance to list some minor things they disagree with.

Appendix C – Document Contributions

Emily Scott's contributions: Added 1 Functional Requirement and associated diagrams and tests. Added 2 Non-Functional Requirements and associated tests. Completed the content and formatting of the appendices. Wrote an outline of the document for internal use and assigned team roles for the document's creation. 20% Contribution.

Brianna Gannet's Contributions: Added 3 Functional Requirements and associated diagrams and tests. Added 2 Non-Functional Requirements and associated tests. Worked as an overall proofreader and Editor for the team. As Client Liaison, provided input on each section to make sure it was what the client wanted. 20% Contribution.

Brennon Tiensivu's Contributions: Added 1 Functional Requirement and associated diagrams and tests. Added 2 Non-Functional Requirements and associated tests. Completed the text for the sections from the introductions to 1.3. Created the team GitHub, which is linked in the document's references. 20% Contribution.

Hunter Savarese's Contributions: Added 1 Functional Requirement and associated diagrams and tests. Added 2 Non-Functional Requirements and associated tests. Completed section 1.4 and its associated diagram. 20% Contribution.

Matthew Keast's Contributions: Added 1 Functional Requirement and associated diagrams and tests. Added 2 Non-Functional Requirements and associated tests. Completed the text for sections 4, 5, and 6. 20% Contribution.
